

Compiling, linking issues

- Inclusion nightmare and compile time
- How to reduce included files
- PIMPL
- Fast PIMPL
- Template code blow
- Linking C and C++ together
- Order of linking issues
- Static initialization/destruction problem

Header files

- Good for defining interface
- Good for breaking circular dependencies
- Must for templates
- Increase compile time
- Break OO principles

Header files

```
#include <iostream>
#include <ostream>
#include <list>
// none of A, B, C, D, E are templates
// Only A and C have virtual functions
#include "a.h"          // class A
#include "b.h"          // class B
#include "c.h"          // class C
#include "d.h"          // class D
#include "e.h"          // class E

class X : public A, private B
{
public:
    X( const C& );
    B f(int, char* );
    C f(int, C );
    C& g(B );
    E h(E );
    virtual std::ostream& print(std::ostream&) const;
private:
    std::list<C>      clist_;
    D                  d_;
};

};
```

Header files

- Remove `<iostream>` People automatically include `<iostream>`, even if input functions never used.
- Replace `<ostream>` with `<iosfwd>`. Parameters and return types only need to be forward declared. Because `ostream` is `basic_ostream<char>` template, it is not enough to declare.
- Replace "e.h" with forward declaration of class E.
- Leave "a.h" and "b.h": we need a full declaration of the base classes in case of inheritance. The compiler must know the size of bases, whether functions are virtual or not.
- Leave "c.h" and "d.h": `list<C>` and D are private data members of X.

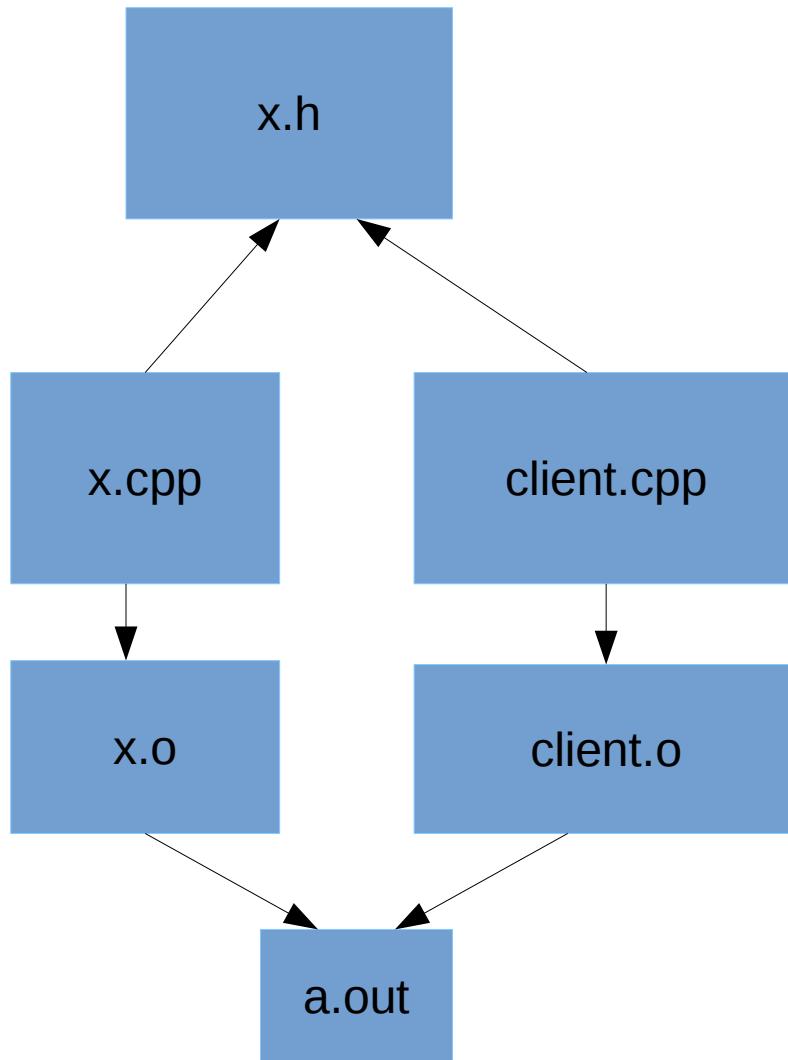

Header files v2

```
#include <iostream>
#include <list>
// none of A, B, C, D, E are templates
// Only A and C have virtual functions
#include "a.h"          // class A
#include "b.h"          // class B
#include "c.h"          // class C
#include "d.h"          // class D

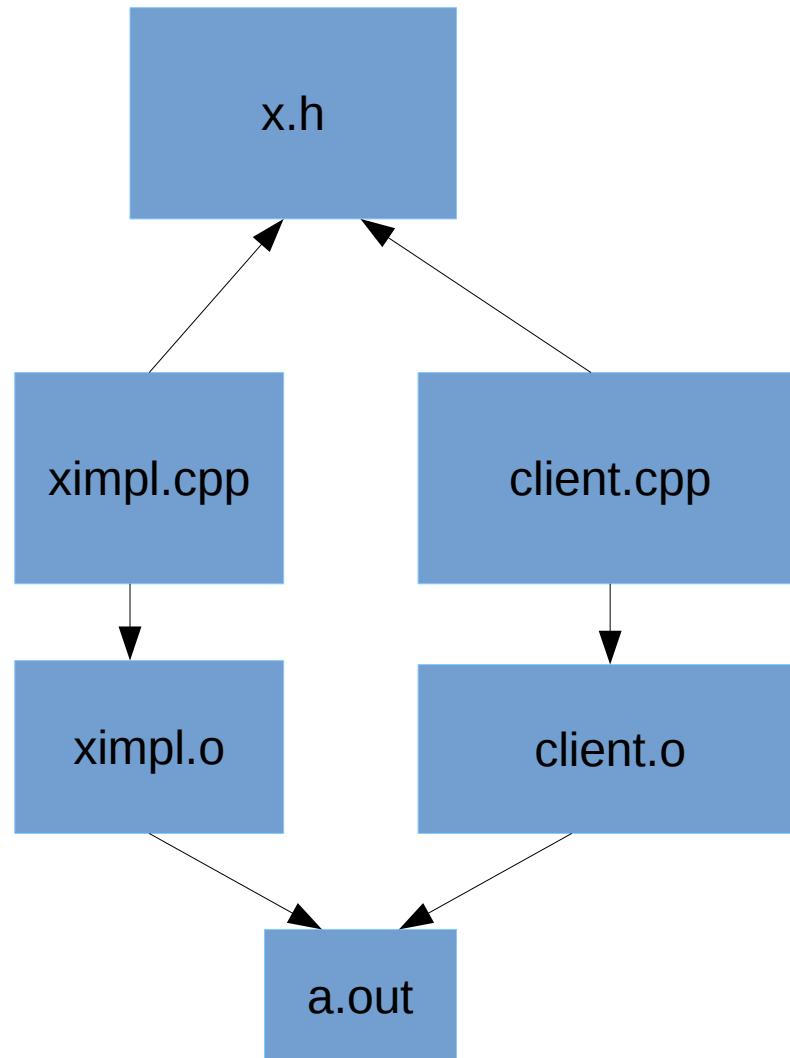

class E;
class X : public A, private B
{
public:
    X( const C& );
    B f(int, char* );
    C f(int, C );
    C& g(B );
    E h(E );
    virtual std::ostream& print(std::ostream&) const;
private:
    std::list<C>      cList_;
    D                  d_;
};

};
```

PIMPL

PIMPL

PIMPL

```
// file x.h
class X
{
    // public and protected members
private:
    // pointer to forward declared class
    struct Ximpl;
    XImpl *pimpl_; // opaque pointer
};

// file ximpl.cpp
struct XImpl // not necessary to declare as "class"
{
    // private members; fully hidden
    // can be changed at without
    // recompiling clients
};
```

PIMPL

```
#include <iostream>
#include "a.h"      // class A
#include "b.h"      // class B
class C;
class E;
class X : public A, private B
{
public:
    X( const C& );
    B f(int, char* );
    C f(int, C );
    C& g(B );
    E h(E );
    virtual std::ostream& print(std::ostream&) const;
private:
    struct Ximpl;
    XImpl *pimpl_; // opaque pointer to forward-declared class
};
// file x.cpp
#include "x.h"
#include "c.h"      // class C
#include "d.h"      // class D
struct Ximpl
{
    std::list<C>    clist_;
    D               d_;
};
```

Zoltán Porkoláb: C++11/14

Removing inheritance

```
#include <iostream>
#include "a.h"      // class A
class B;
class C;
class E;
class X : public A // ,private B
{
public:
    X( const C& );
    B f(int, char* );
    C f(int, C );
    C& g(B );
    E h(E );
    virtual std::ostream& print(std::ostream&) const;
private:
    struct Ximpl;
    XImpl *pimpl_; // opaque pointer to forward-declared class
};
// file x.cpp
#include "x.h"
#include "b.h"      // class B
#include "c.h"      // class C
#include "d.h"      // class D
struct Ximpl
{
    B b_;
    std::list<C> clist_;
    D d_;
```

Fast PIMPL

```
// file x.h
class X
{
    // public and protected members
private:
    static const size_t XImplSize = 128;
    char ximpl_[XImplSize]; // instead opaque pointer
};

// file ximpl.cpp
struct XImpl // not necessary to declare as "class"
{
    Ximpl::Ximpl(X *tp) : _self(tp) {
        static_assert (XImplSize >= sizeof(XImpl));
        // ...
    };
    X *_self; // might be different than XImpl::this
};
X::X() { new (ximpl_) XImpl(this); }
X::~X() { (reinterpret_cast<XImpl*>(ximpl_))->~XImpl(); }
```

Template code blow

- Templates are instantiated on request
- Each different template argument type creates new specialization
 - Good: we can specialize for types
 - Bad: Code is generated for all different arguments
 - All template member functions are templates

Template code blow

```
template <class T>
class matrix
{
public:
    int get_cols() const { return cols_; }
    int get_rows() const { return rows_; }
private:
    int cols_;
    int rows_;
    T *elements_;
};

matrix<int>      mi;
matrix<double>   md;
matrix<long>     ml;
```

Template code blow

```
class matrix_base
{
public:
    int get_cols() const { return cols_; }
    int get_rows() const { return rows_; }
protected:
    int cols_;
    int rows_;
};

template <class T>
class matrix : public matrix_base
{
private:
    T *elements_;
};
```

Using C and C++ together

- Object model is (almost) the same
- C++ programs regularly call C libraries
- Issues:
 - Virtual inheritance
 - Virtual functions (pointer to vtbl)
 - Mangled name vs C linkage name

Using C and C++ together

```
//  
// C++ header for C/C++ files:  
//  
#ifdef __cplusplus  
extern "C"  
{  
#endif  
    int      f(int);  
    double   g(double, int);  
    // ...  
#ifdef __cplusplus  
}  
#endif
```

Place of instantiation

```
#include <iostream>
#include <algorithm>

template<typename T>
struct Test{
    void operator()(T& lhs,T& rhs){
        std::swap(lhs,rhs);
    }
};

struct MyT { };

namespace std {
    inline void swap(MyT& lhs,MyT& rhs){
        std::cout << "MySwap" << std::endl;
    }
}

int main()
{
    MyT t1,t2;
    Test<MyT>{}(t1,t2);
}

$ ./a.out
$
```

Place of instantiation

```
#include <iostream>
#include <algorithm>

// move Test from here
struct MyT { };

namespace std {
    inline void swap(MyT& lhs, MyT& rhs){
        std::cout << "MySwap" << std::endl;
    }
}

// to here
template<typename T>
struct Test{
    void operator()(T& lhs, T& rhs){
        std::swap(lhs, rhs);
    }
};

int main()
{
    MyT t1, t2;
    Test<MyT>{}(t1, t2);
}

$ ./a.out
MySwap
$
```

Order of linking?

```
// file: a.cpp
static int s = 2;
#include "t.h"
int g()
{
    return t(1);
}
```

```
// file: b.cpp
static int s = 1;
#include "t.h"
int h()
{
    return t(1);
}
```

```
$ g++ main.cpp a.cpp b.cpp && ./a.out
2 2
```

```
// file: t.h
template <class T>
T t(const T&)
{
    return s;
}

// file: main.cpp
#include <iostream>
extern int g();
extern int h();
int main()
{
    std::cout << g() << std::endl;
    std::cout << h() << std::endl;
    return 0;
}
```

Order of linking?

```
// file: a.cpp
static int s = 2;
#include "t.h"
int g()
{
    return t(1);
}
```

```
// file: b.cpp
static int s = 1;
#include "t.h"
int h()
{
    return t(1);
}
```

```
$ g++ main.cpp b.cpp a.cpp && ./a.out
1 1
```

```
// file: t.h
template <class T>
T t(const T&)
{
    return s;
}

// file: main.cpp
#include <iostream>
extern int g();
extern int h();
int main()
{
    std::cout << g() << std::endl;
    std::cout << h() << std::endl;
    return 0;
}
```

Static initialization/destruction

- Static objects inside translation unit constructed in a well-defined order
- No ordering **between** translation units
- Issues:
 - (1) Constructor of static refers other source's static
 - Destruction order
- Lazy singleton solves (1)
- Phoenix pattern solves (2)
