- Capacitor:
 - is a device for storing electric charge;
- consists of two conducting objects which do not touch;
- typically two parallel plates separated by a distance l, and having an insulator between them;
- when connected to a battery, the capacitor becomes charged;
- - the amount of charge acquired by each plate is: Q = CdV:

Electric Current

Capacitance

for a parallel plate capacitor of area A we have:

$$E = \frac{Q}{\varepsilon_0 A}; dV = -\int_a^b \vec{E} d\vec{l};$$

$$C = \frac{Q}{dV} = \varepsilon_0 \frac{A}{l};$$
(1)

the capacitance of a single isolated conductor,
 for ex. a sphere of radius r,
 relative to V=0 at infinity is:

$$V = \frac{1}{4\pi\varepsilon_0} \frac{Q}{r};$$

$$C = \frac{Q}{V} = 4\pi\varepsilon_0 r;$$

Capacitance

Capacitors

Electric Current

- if the capacitors are connected in series
 - a charge +Q flows from the batery to the left plate of C_1 ;
 - and -Q flows to the right plate of C_3 ;
- if the regions between the capacitors are originally neutral,
 - the net charge there must be zero;
- the +Q on C₁ attracts a charge of -Q on the opposite plate and so on;
- a single capacitor that could replace these three in series without affecting the circuit will be:
